CHUNKFEEDER SIX FONTS

Chunkfeeder was inspired by the vernacular forms of lettering created for high speed printing and electronic displays. These letters are seen all around us in such things as postage packing slips, airline tickets and informational video displays. Many of these fonts are designed by engineers and interface designers who presumably do not have a background in letterform design. Consequently these glyphs have many idiosyncrasies.

In keeping with it's mechanical inspiration, Chunkfeeder is monospaced, much like an Optical Character Recognition (OCR) font. Chunkfeeder has a rather ridged modularity but it incorporates more typographic nuance into the letterforms than most other fonts of this style, while exploiting some of the quirky visual artifacts of high speed printing.

Chunkfeeder is a versatile family of 6 fonts—3 weights, each with an accompanying oblique.

Optical character recognition: Often abbreviated OCR, optical character recognition refers to the branch of computer science that involves reading text from paper and translating the images into a form that the computer can manipulate (for example, into ASCII codes). An OCR system enables you to take a book or a magazine article, feed it directly into an electronic computer file, and then edit the file using a word processor.

All OCR systems include an optical scanner for reading text, and sophisticated software for analyzing images. Most OCR systems use a combination of hardware (specialized circuit boards) and software to recognize characters, although some inexpensive systems do it entirely through software. Advanced OCR systems can read text in large variety of fonts, but they still have difficulty with handwritten text.

The potential of OCR systems is enormous because they enable users to harness the power of computers to access printed documents. OCR is already being used widely in the legal profession, where searches that once required hours or days can now be accomplished in a few seconds.
